Willow Gloves
Hypocreopsis lichenoides

What to do if you find it:

**Make an observation**
The first thing to do is to record your observation. We prefer to use the iNaturalist app for that (visit www.iNaturalist.org to learn more), but you could also upload your observation to Mushroom Observer (visit www.MushroomObserver.org). The QR code to the right will take you to the Fungal Diversity Survey (FunDIS for short) website to explain how to contribute to the project.

The best thing you can do is take lots of photographs and notes. Typically, smartphones will automatically georeference any photos taken, but it is good practice to note your exact location, preferably with GPS coordinates, and be sure to note what trees are nearby, and any other salient features. For example, was the mushroom growing under a hemlock, or a Douglas fir? Did it have a particular smell?

**Collect a specimen**
If you are in an area where it is allowed and have any necessary permits, we strongly urge you to create a vouchered collection. This means a dried specimen for deposit in a herbarium, where researchers can access it for things like DNA sequencing. If you don’t know how to do this, please see:

In California, collecting mushrooms is usually allowed in National Forests with a permit. Permits can be obtained at the headquarters of the National Forest you’re visiting, and are usually inexpensive or free. However, restrictions vary among the individual National Forests, so make sure to find out the specifics when picking up your permit. In Oregon and Washington, you are typically allowed to collect one gallon without a permit on most public lands; but not all, so be sure to check! In BC, collecting is allowed on Crown land without a permit, but it’s illegal to pick mushrooms in a provincial or national park.

Don’t forget to look for other mushrooms and fungi while you’re there! Since you’ve already got iNaturalist open, why not record your other finds?

**Habitat**

Find Willow Gloves growing on willow shrubs or trees, and occasionally on other tree species. Dense willow thickets would be good places to check for this fungus. They are typically found in shady, moist areas near bodies of water, and can be found on both living and dead branches.

**Willow Gloves**

Willow Gloves is considered to be a parasite of the fungus Willow Glue (Hydnoporia tabacina), which is a tobacco-brown crust fungus. Look for the crust as well!

**Status:** RARELY COLLECTED

Is that a gloved hand grasping a willow stick? If you see weird orange-brown fingers or lobes curving around the smooth bark of a branch, all growing from a central point, you have found Willow Gloves! Yes, this is a fungus, and when mature is dusted with orange powdery spores.

**Description**

The species name of Willow Gloves means "lichen-like", as can be seen in their growth form. This lichen look-alike lays flat, and is fleshy, with irregularly lobed, orange-brown, finger-like projections radiating out from a central point. The entire fungus can be up to 4 inches in diameter, is usually about ¼ inch thick, and clings closely to the bark of the willow it’s growing on. When mature, the surface of Willow Gloves is dusted with orange-brown spores.

**What else could it be?**

**Hazel Gloves** (*Hypocreopsis rhododendri*) looks very similar, but grows *surprise surprise* on *Rhododendron* in the eastern USA. In Europe it is found on hazelnuts. It is also a parasite, but has not been found on the West coast. It is one of the species in the **Northeast Rare Fungi Challenge**!

**When & Where?**

The fruiting body is **tough and persists year-round**, but will be easier to find in the **far Northern latitudes** in the warmer summer months. The two finds from **Alaska** were made in **August**.

**Potential Range**

As a circumboreal species, Willow Gloves can likely be found in **high Northern latitudes** in North America and Europe. So far, the only North American observations have been in **Alaska**.

**Potential Range**

Based on the ranges of northwest *Salix* spp. Data from Conservation Biology Institute and USFS. [www.fs.fed.us/database/feis/pdfs/Little/aa_Supporting-Files/LittleMaps.html](http://www.fs.fed.us/database/feis/pdfs/Little/aa_Supporting-Files/LittleMaps.html). Map layer from Stamen Design.
